

Decomposition: Delivery Robot (Answers)

Name:

Class:

Decomposition is when you break a task into smaller and smaller tasks. Look at this diagram showing the tasks for creating a delivery robot system.

The main task is to “*Deliver goods to customers using automated robots*”. In order to achieve this, the main task has been broken down into 5 sub-tasks.

What are the sub-tasks that the main task has been broken into?

1. **Set up a system to allow customers to order the goods they want**
2. **Set up a system to allow customers to pay for the goods they want**
3. **Navigate to the customer's home**
4. **Notify the customer the delivery has arrived**
5. **Navigate back to the packing area to collect the next delivery**

The sub-task “*Set up a system to allow customers to order the goods they want*” has been broken into 3 further sub-tasks. **What are they?**

1. **Show the customers the stock that is available**
2. **Allow customers to add their desired items and quantity to the basket**
3. **Items which are out of stock are not added to the order**

You are going to decompose one of the *other* sub-tasks. You can pick any of the other sub-tasks to break it down into smaller sub-tasks.

Which sub-task are you going to decompose?

Student's answers will differ but it should be one of the *other* tasks which is already on the diagram

Use the space below to write the sub-tasks for the task you have picked. Remember to write them as sentences to explain the task that needs to be completed, in order to set up a robot delivery system. You do not have to use all the spaces allocated below.

Student's answers will differ but they should relate to the task they have chosen and be sensible answers to help break that task into sub-tasks
