

Types of Attack

Name: _____

Class: _____

Read the statements and then choose if it is an active attack, passive attack, social engineering or an insider attack

Description	Type of Attack
This is when a person is tricked into giving away information that gives others access to the network or accounts. This can be done by pretending to be somebody else (such as a victim's bank), watching over their shoulder as they enter data (such as a PIN) or stealing access cards through pick-pocketing.	
This is when somebody spies on the system and scans for vulnerabilities. A passive attack does not change any data and is only used to gather information about a system, usually in preparation for an active attack.	
An employee, former employee, contractor or business associate that has access to the system may steal sensitive information or give away access details to others.	
This is when someone uses software such as a virus or other technical methods to compromise a network's security and take control of its devices and make changes to data either on the system or when it is travelling through networks. These can include a Denial of Service (DoS) attack, brute force attack or a malware attack which we will be learning about later in this workbook.	

Find a news story about a cyber-attack on a company and write a sentence to answer each of the following questions:

Who were the cybercriminals targeting?

How did the cybercriminals attack the company?

What were the cybercriminals hoping to achieve?
